Episode scope, devices and measurement methods

Tower Rush India | https://towerrushindi.com/en/methodology/

Separate objects before comparing results

The method follows product identity, rules and mode, an individual episode, its monetary ledger, the calculation and a conclusion confined to that scope. Games, RTP configurations and access operators are three different objects of comparison. Cashout settles the game; a transfer between wallets and an external withdrawal are different events.

Karthikeyan Sengupta is the author and participant in the reported episodes, with seven years of iGaming, betting, gambling-product and payment-system analysis. The main records are dated 3–4 November 2026 in India, using IST (UTC+05:30). A tournament time in UTC differs by 5 hours 30 minutes. Historical page states belong to their snapshot, not to a newly inferred registration right.

The recorded environment

Environment	Details
ENV-A	Realme 14 Pro+, India; Android 15; realme UI 6.0; arm64-v8a
ENV-I	iPhone 15 Pro; iOS 26.5; Opera 6.8.1 in the WebKit web container
ENV-D	Lenovo ThinkPad T14 Gen 4; Windows 11 24H2 x64; 16 GB RAM
Android browser	Opera Android 102
Desktop browsers	Brave 1.98.63; Chrome 156.0.8078.80 Stable
Desktop viewport	1440×900 CSS px, 100% zoom
iPhone orientations	393×852 portrait; 852×393 landscape CSS px
Android orientations	412×915 portrait; 915×412 landscape CSS px
Main connection	Airtel Wi-Fi: 82.5 Mbit/s down, 24.8 Mbit/s up
Separate recovery connection	Jio 5G
Access channels	Operator Android APKs or Stake PWA; Opera web route on iOS; desktop browser

The device remains the same within a series. Separate Android and iOS series exist for each of the ten operators. Linux, macOS and iPad are outside this episode matrix. VPN use and bypassing regional restrictions are not included. Line speed in Mbit/s is not game-opening time.

Version and binary identity

An APK version, its byte size, cryptographic checksum, signing certificate, targetSDK, compileSDK and manifest settings belong to the particular binary distribution. A browser version is not the game version. Chromium or WebKit, browser version, site version and APK version remain separate. An iOS WebView route in a specified container is not a standalone Tower Rush IPA.

What a timing series measures

Game-launch timing starts when the Tower Rush card is pressed and ends when the Build button and stake field become usable. A logo is not interactive readiness. Cold launches use cleared site data; repeated launches retain cache. Lobby and cashier timings are separate actions. Compare the same game version, launch type, environment, cache and network. A 0.240-second action-acceptance delay is neither the complete animation time nor network throughput.

Ledger and probability boundaries

Retain each operator, currency, account, channel and period. International Melbet and Russian Melbet are not one profile; recorded 1w material and the 1Win India episode are also separate. FUN observations are not combined with cash monetary statistics. A refund is not gross winnings. Compare fixed turnover rather than assuming equal deposits produce equal stakes.

For TR-DEMO-01, the complete accepted-cycle ledger is in G03-demo.pdf. Its 16 settled cycles exclude one void for the comparable return denominator. The separate fixed-versus-doubling model in G13-strategy.pdf uses 20,000 runs per policy and its own two-outcome distribution; it does not reproduce game-engine floor outcomes.
